

## Wire and Cable Technology International

### Sicme Italia Impianti MC Stand 12D72 Italy

Sicme Italia Impianti MC is a leading global manufacturer of equipment for making insulated wire. Since 1959 we have been operating in the enameled wire industry, selling more than 17,000 lines all over the world and serving customers with cooperation and know-how. We are now the oldest company operating in this industry and thanks to our long experience we can satisfy both standard or specific requests with tailored solutions. We are the first and only manufacturer in the world able to combine the new technologic and modern enameling machines with the use of natural gas for thermal power and our latest model, the Super Compact, is achieving success with client satisfaction. Come and visit us in Stand 12D72 for discussing further the opportunities. To better control quality, most of components are made internally and our range of product is wide (rod breakdown machines, drawing machines, annealing ovens, enamelling ovens, take-ups, payoffs, etc). Our unremitting research is focused on producers and, even when reduction in production costs seemed to be exhausted, our company has identified a further and significant possibility: to reduce thermal costs by using natural gas. Although the study and the tests have taken about eight years of work, this technology today is affirmed and safe and Super Compact gas machines had been sold in Italy with a concrete result of 70% thermal production cost reduction.

## Wire and Cable Technology International

### Sicme's Next-Generation Vertical & Horizontal Enamelling Plants

Sicme Italia Impianti has introduced next-generation vertical and horizontal enamelling plants, which the company says incorporate superior technology far ahead of any other machine on the planet. Sicme says these enamelling plants will change the way enameled wire is produced forever.

For the first time in the history of the wire industry, Sicme Italia Impianti presents the first-ever Hybrid enamelling plant technology—to utilize full heat energy with almost zero waste. In other words, smart use of every unit of energy to give customers better profit margins and better return on investment.

According to the company, the gas technology of these machines really reduces by three times the thermal cost of producing 1 kg of enamelled wire.
